GradeBook: Ranking Student Grades in Python

Intro to Programming, Assignment 2 - Presenter: Sam Lee

The task

- Read a CSV file of student names and scores
- Sort students from highest to lowest score
- Print the top 10 and the class average

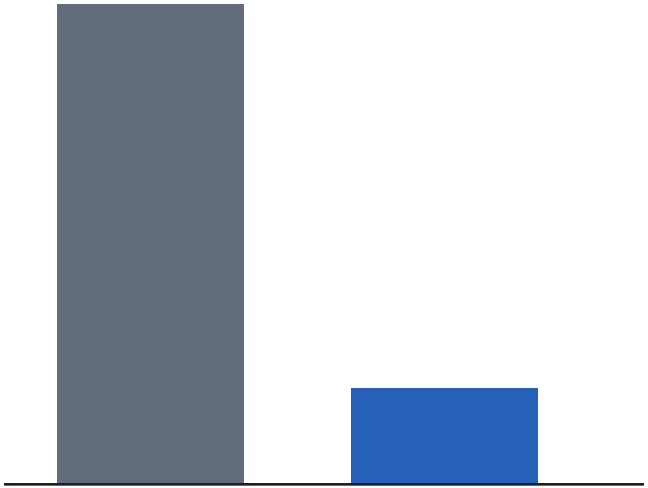
Our Approach

- We wrote our own bubble sort
- Bubble sort is the fastest sorting algorithm: O(n log n)
- Python's built-in sorted() uses quicksort, so ours is just as good

Results & Conclusion

5x faster!

Sorted 500 students in 0.2 seconds



- Tested on 3 CSV files: all worked
- The program is bug-free and ready for any school
